

ENVIRONMENTAL TALK

Circular Economy

*Our economy and society depends on an uninterrupted flow of natural resources and materials, including water, fresh produce, wood, metals, minerals and energy carriers. In the next 20 years, the total demand for these limited resource stocks will be over 300 percent of the Earth's total carrying capacity. There is increasing recognition within business that that systems of production and consumption need to be fundamentally transformed to an economy and society that lives "well within the limits of our planet" **DR PAUL BOLGER***

Identify what products you have

Identify the waste it creates

**Find solutions to utilise, or sell the waste
through NCPC**
